ABSTRACT

Combining ability analysis revealed that good general combiners were Urvashi x KMR-15-2, Pusa Agrani x Pusa Bahar, RH-749 x Pusa Bahar, RH-749 x Durgamani and KMR-15-2 x Pusa Bahar were best specific combiners for seed yield per plant. In hybrid high heterosis over better and mid parent Urvashi x KMR-15-2, Pusa Agrani x Durgamani, RH-749 x KMR-15-2, KMR-15-2 x Pusa Bahar and KMR-15-2 x Durgamani and Urvashi x KMR-15-2, Pusa Agrani x Pusa Bahar, RH-749 x Pusa Bahar, KMR-15-2 x Pusa Bahar and KMR-15-2 x Durgamani, respectively and high x high general combiners with significant sca effects for seed yield per plant. The parents namely, Urvashi, KMR-15-2, Pusa Agrani, Pusa Bahar, RH-749, Pusa Bahar, RH-749, Durgamani, KMR-15-2 and Pusa Bahar were good general combiners for number of traits and hence, may be used further in hybridization programme. Developmental attributes likes days to flowering, days to maturity, number of siliquae per plant and oil content, 1000-seed weight, seed yield per plant should be given maximum frequency for getting higher productivity in Indian mustard.

KEYWORDS

Combining Ability (Gca and Sca), Diallel Analysis, Heterosis, Indian Mustard, Seed Yield

Indian mustard [Brassica juncea (L.) Czern and Coss], which is cultivated under the genus Brassica is cultivated all over India and it is throughout the world belongs to family Cruciferae (Brassicaceae). It has 38 to 42 % oil and 24% protein. India is one of the major producers in the global oilseeds/vegetable oil economy. There is a severe shortage of edible oil in the country. The per capita availability of edible oil is only 11 (g)/day as against the normal requirement of 30 (g)/day. Thus the availability of energy through oil is word limited. Insufficient fat consumption reflects the poor living standards of the people. Even at this minimum level of consumption the country imports substantial quantities of edible oil.
Rapeseed and mustard oil is used primarily for edible purposes and is the principle cooking oil in the mustard growing area of the country. Known for its great taste and subtle flavor, this vegetable oil is the world’s second leading source of protein meal. Besides seeds, it is used as condiments. The meal cake left after oil extraction forms important cattle feed and may also be used as organic manure.

Important oil seed crop grown in cool season sub tropics, higher elevations and winter crops. Rapeseed oil was produced in the 19th century as a source of a lubricant for steam engines. The oil and protein content varies from 37 to 49% and 22-28%, respectively. The seed and oil are used as condiments in the preparation of pickles and for flavouring curries and vegetables. Rapeseed-mustard oil has high level of antioxidant, which retards growth of free radicals mainly responsible for disease like cancer and ageing. Glucosinolates present in seed meal has shown anticancer properties. *Brassica* species are very rich in phenolic compounds and glucosinolates. *Brassicas* are rich source of vitamins, minerals and contains many medicinal properties. They provide high amounts of vitamin C, soluble fiber and contain multiple nutrients with potent anti-cancer properties. Oil is used in Northern India for cooking and frying purposes. It is also used in preparation of hair oil and medicines. It has industrial importance in soap making and in mixtures with mineral oils for lubrication and grease for various machines. Tender leaves of young plants are used as green vegetable and are good source of sulphur and other minerals in diet.

The estimated area, production and yield of rapeseed-mustard in the world was 36.68 million hectares (mha), 72.42 million tonnes (mt) and 1974 kg / ha, respectively, during 2017-18. Globally, India account for 19.8 % and 9.8% of the total acreage and production (USDA 2016-17). During the last seven years, there has been a considerable increase in productivity from 1840 kg/ha in 2010-11 to 1974 kg/ha in 2017-18 and production has also increased from 61.64 m t in 2010-11 to 72.42 m t in 2017-18.

**Materials and Methods**

The present experiment consisting of seven genetically diverse genotype namely, Urvashi, PM-27, Pusa Agrani, RH-749, KMR-15-2, Pusa Bahar and Durgamani using in a diallel set (excluding their reciprocals) were crossed with each other in all the possible combinations to produce sufficient F0 seed of 21 crosses laid out in randomized block design with three replications at Oilseed Research Farm, Kalyanpur, Kanpur during *rabi* 2017-19. F0 seeds of different crosses were grown to produce F1 seeds. The plants for recording detailed observations were taken randomly after 30 days of sowing. In each replication, the number of plants in each parent was five, in each F1's was ten.

The observations were recorded on the following ten qualitative and quantitative traits, viz., days to 50% flowering, days to maturity, plant height (cm), length of main raceme (cm), number of siliquae per plant, number of primary branches per plant, number of secondary branches per plant, oil content (%), test weight (g) and seed yield per plant (g). Oil content was estimated in per cent using Nuclear Magnetic Resonance (NMR) Oxford 4000 Analyzer. The analysis of variance for the experimental design is based on the method suggested by (Panse and Sukhatma, 1967). Testing the validity of the hypothesis i.e., the assumptions regarding diallel analysis as proposed by (Hayman, 1954a). The combining ability analysis was carried out by the procedure suggested by (Griffing's, 1956 b) method 2, model 1.

**Results and Discussion**

The analysis of variance for combining ability was done and the results are presented in table 1 and 2. The mean sum of square due to gca were highly significant for all the characters. The mean sum of square due to gca was highly significant for all the characters except days to 50% flowering. The estimated variance of general combining ability ($\sigma^2_{gca}$) were higher than variance of specific combining ability ($\sigma^2_{sca}$) for all the characters. The results for combining ability are presented in table 3 and 4. The parents namely, Urvashi, PM-27, Pusa Agrani, Durgamani, KMR-15-2 and RH-749 were best general combiners for days to 50% flowering, days to maturity, plant height (cm), length of main raceme (cm), number of siliquae per plant, number of primary branches per plant, number of secondary branches per plant, oil content (%), test weight (g) and seed yield per plant (g). Similar finding were also observed by (Chauhan et al. 2011 and Singh et al. 2011).

*, ** significant at 5 and 1 per cent level, respectively
The crosses namely, Urvashi x KMR-15-2, Pusa Agrani x Pusa Bahar, RH-749 x Pusa Bahar, RH-749 x Durgamani, KMR-15-2 x Pusa Bahar, Pusa Agrani x Durgamani, PM-27 x Durgamani, Pusa Agrani x KMR-15-2, Urvashi x Durgamani, Urvashi x Pusa Agrani, Pusa Bahar x Durgamani, Pusa Agrani x RH-749 and PM-27 x KMR-15-2 were best specific combiners for days to 50% flowering, days to maturity, plant height (cm), length of main raceme (cm), number of siliquae per plant, number of primary branches per plant, number of secondary branches per plant, oil content (%), test weight (g) and seed yield per plant (g). These findings were also similar to (Arifullah et al., 2012, Dond et al., 2012, Khosepatil et al., 2012 and Singh et al., 2012).

Table 5 revealed that high heterosis over better and mid parent Urvashi x KMR-15-2, Pusa Agrani x Durgamani, RH-749 x KMR-15-2, KMR-15-2 x Pusa Bahar and KMR-15-2 x Durgamani and Urvashi x KMR-15-2, Pusa Agrani x Pusa Bahar, RH-749 x Pusa Bahar, KMR-15-2 x Pusa Bahar and KMR-15-2 x Durgamani, respectively and high x high general combiners with significant sca effects. In F1's hybrid, high heterosis over economic parent (>10%) was found in RH-749 x Pusa Bahar, high x high general combiners with significant sca effect for days to 50% flowering, days to maturity, plant height (cm), length of main raceme (cm), number of siliquae per plant, number of primary branches per plant, number of secondary branches per plant, oil content (%), test weight (g) and seed yield per plant (g). Similar findings were also observed by (Lal et al., 2013, Frasat et al., 2013, Priyamedha et al., 2013 and Shekhawat et al., 2014).

Acknowledgement

The authors are grateful to Chandra Shekhar Azad University of agriculture and Technology, Kanpur for providing necessary facilities to undertake this study. The authors are also thankful to Dr. S. Solomon, Hon’ble Vice - Chancellor and Dr. H. G. Prakash, Director Research of C. S. A. University of Agriculture and Tech., Kanpur, U.P. for providing facilities for successful conducting this study.
